

E-Governance Presentation

E-Governance Initiatives in the United States

Ayush Tuladhar

Bsc. CSIT VI

📅 Oct 5, 2026

Introduction to E-Governance

Use of ICT to deliver government services, share information, and involve citizens in decision-making

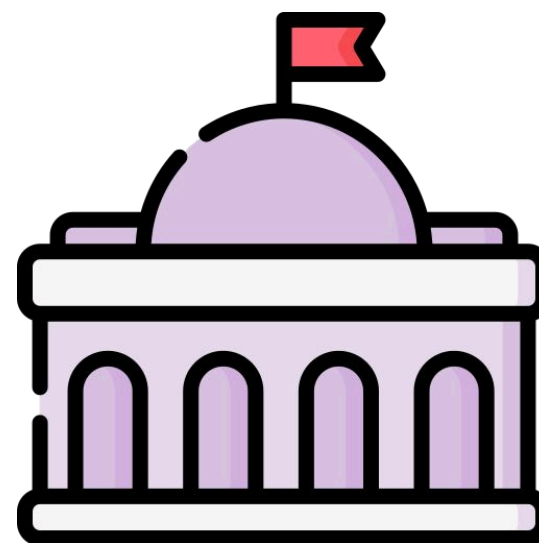

Government-to-Consumer (G2C)

Services and information for the public like tax filing

Government-to-Business (G2B)

Contracts, licences, payments and procurement

Government-to-Government (G2E)

Data sharing between agencies and levels

Government-to-Employee (G2E)

Internal systems and workflows

Evolution of U.S. E-Governance

2 Foundation of E-Government : 2000–2008

- E-Government Act (2002)
- USA.gov
- Regulations.gov
- Federal CIO and Office of E-Government
- FISMA/security requirements

4 Digital Service Reform : 2014–2018

- HealthCare.gov failure and subsequent reform
- U.S. Digital Service (USDS)
- 18F
- Login.gov
- Greater emphasis on agile and user-centered development

1 Early Computerization : 1980s–1990s

- Automation of internal government processes
- IRS electronic tax filing
- Paperwork Reduction Act
- Clinger-Cohen Act (1996)
- Development of agency IT management

3 Open and Digital Government : 2009–2013

- Open Government Directive (2009)
- Data.gov
- USAspending.gov
- Digital Government Strategy (2012)
- Digital-first and mobile-ready services

5 Modern Digital Government : 2018–Present

- 21st Century IDEA Act (2018)
- Modern and accessible federal websites
- Mobile-friendly digital services
- Expansion of shared digital infrastructure
- Continued focus on cybersecurity, accessibility and user experience

Laws and Policies Behind E-Governance

E-Government Act of 2002

Established the Office of E-Government and Federal CIO role.

Federal Funding Accountability and Transparency Act, 2006

Increased transparency of federal spending.

Open Government Directive, 2009

Encouraged agencies to publish high-value data.

Digital Government Strategy, 2012

Promoted digital-first and mobile-ready services.

DATA Act, 2014

Strengthened transparency of federal spending.

21st Century IDEA Act, 2018

Required modern, accessible and mobile-friendly federal digital services.

Transparency and Open Data

Data.gov

- National catalogue of government datasets
- Provides data in open, machine-readable formats
- Supports research, innovation and public oversight

USAspending.gov

- Allows the public to examine federal contracts and grants
- Strengthened through the DATA Act

Regulations.gov

- Allows citizens to view and comment on proposed federal regulations

Impact :

Greater government transparency

Easier access to public information

Increased citizen participation

Opportunities for research and private-sector innovation

Major Citizen Services

**Citizens can
access many
government
services
remotely,
reducing
paperwork,
travel and
waiting time**

USA.gov

Main gateway to U.S. government
information and services

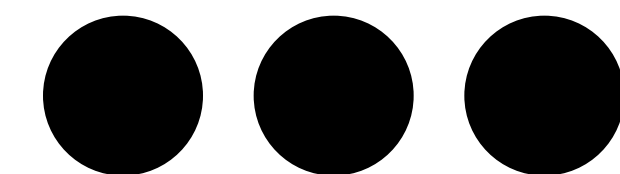

IRS Online Services

Electronic tax filing, online tax
payments, digital taxpayer services

Login.gov

Provides a shared sign-in and identity
verification service across
participating government services

Other Digital Services

Social Security online accounts,
online passport services, Veterans
Affairs digital services

Digital Infrastructure & Security

Cloud First / Cloud Smart

Encouraged government agencies to adopt cloud-based technologies.

FedRAMP

Provides a standardized security assessment for cloud services used by federal agencies

FISMA and NIST

Provide important requirements and standards for federal information security.

Section 508

Requires federal electronic information to be accessible to people with disabilities.

21st Century IDEA Act

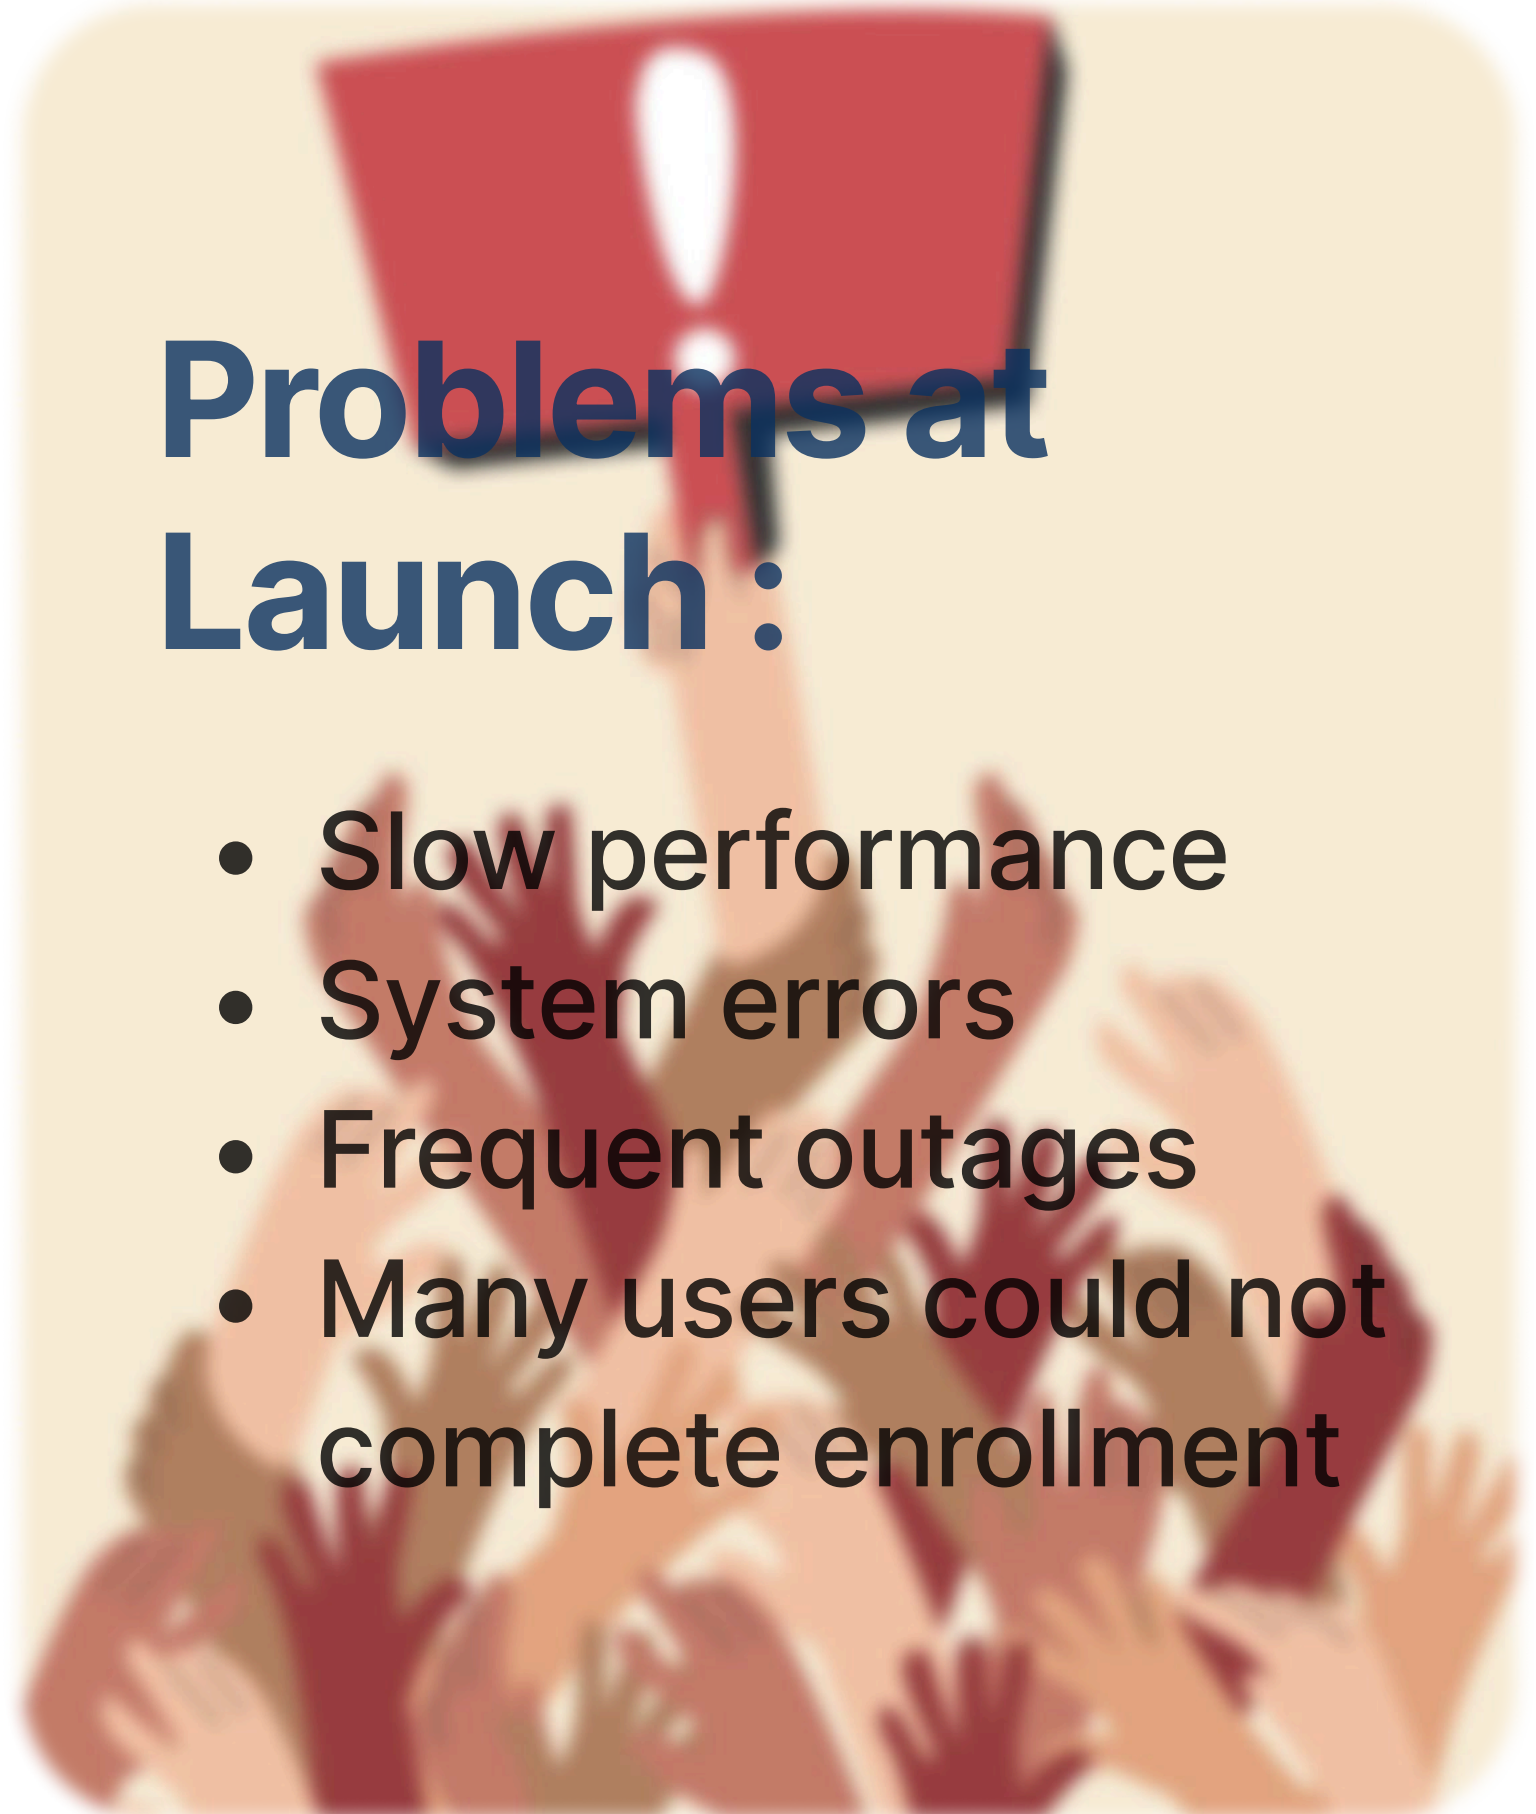

Further promotes accessible, consistent and mobile-friendly digital experiences.

Case Study: HealthCare.gov

HealthCare.gov launched on October 1, 2013 under the Affordable Care Act

It was designed as an online marketplace for health insurance

Problems at Launch :

- Slow performance
- System errors
- Frequent outages
- Many users could not complete enrollment

Causes Identified by the GAO :

- Weak planning
- Unclear responsibilities among contractors
- Inadequate oversight
- Insufficient testing before launch

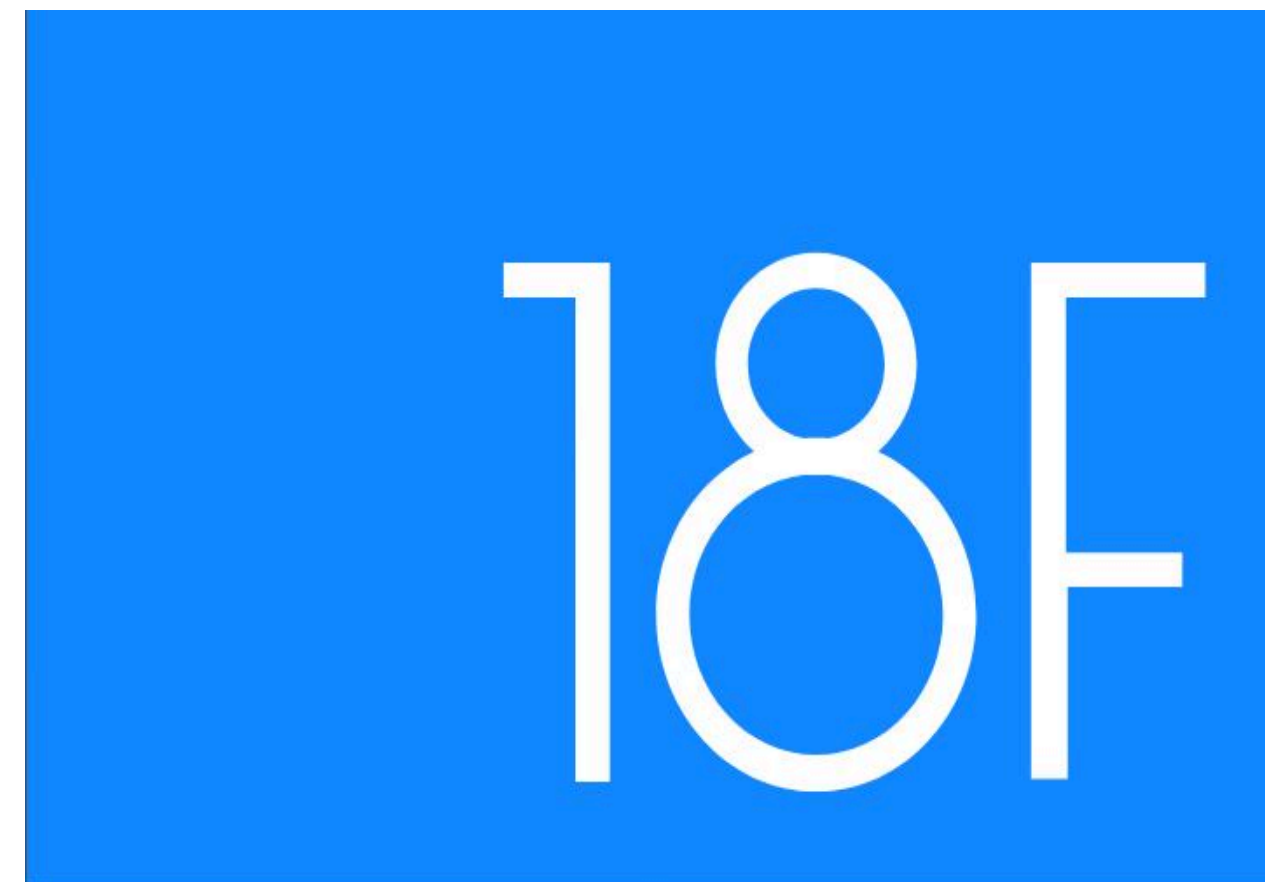

The Response: USDS and 18F

U.S. Digital Service (USDS)

- Created in 2014
- Brings technology expertise into government
- Helps agencies improve digital services.

18F

- Created within the General Services Administration
- Supports agencies in developing better digital services.

New Approach :

User-centred design

Testing with real users

Agile development

Small and frequent releases

Technical expertise within government

Benefits and Challenges

Benefits

- **Transparency:** Open data makes government activity easier to inspect
- **Convenience:** Online services reduce travel and paperwork
- **Efficiency:** Shared platforms reduce duplication
- **Participation:** Citizens can comment on proposed regulations
- **Innovation:** Public data supports research and private applications

Challenges

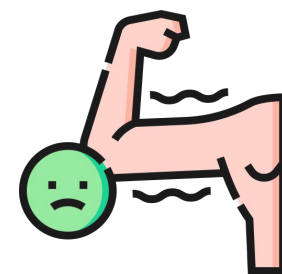

- **Legacy government systems**
- **Fragmentation between federal, state and local systems**
- **Complex procurement**
- **Cybersecurity and privacy risks**
- **Digital divide**
- **Uneven quality between government agencies**

Analysis and Lessons Learned

Strengths

- Strong legal and policy framework
- Open government data
- Mature technology sector
- Increasing use of shared platforms

Weaknesses

- No single national digital identity
- Fragmented government systems
- Different levels of service quality between agencies

Lessons Learned :

- Design services around real user needs
- Test systems before large-scale deployment
- Build shared platforms for identity, payments and security
- Maintain technical expertise inside government
- Use small, staged releases instead of one large launch
- Include accessibility, privacy and security from the beginning

Conclusion

U.S. e-governance has evolved from basic computerization and web portals into a broader digital government ecosystem

Initiatives such as USA.gov, Data.gov, USAspending.gov, IRS e-file, Login.gov, FedRAMP and USDS demonstrate different aspects of digital government

The USA has achieved significant progress in:

- Transparency
- Digital service delivery
- Shared infrastructure
- Citizen access

However, legacy technology, fragmented systems, cybersecurity, privacy and digital inclusion remain challenges.

The HealthCare.gov experience demonstrates that successful e-governance depends not only on technology, but also on policy, management, procurement, coordination and people.
